Painting Your Room

Pick a room in your house that you would like to paint.

Calculate the surface area of the room (round all measurements up to the next ½ ft).

Subtract the area of any objects that won’t be painted (windows, doors etc).

What brand, finish, and color of paint are you going to use?

Figure out the coverage (on label) and price per gallon of your paint.

How many gallons of paint will you need?

Do you need other materials to do the job (brushes, rollers, blue tape etc)?

Answers needed:

Total area to be painted?

Cost of paint?

List and cost of other materials?

Final cost of job?
